Arduino UNO R4 Minima CAN Bus

Learn how to send messages using the CAN bus on the UNO R4 Minima.

Author · Karl Söderby · Last revision · 10/07/2025

ON THIS PAGE

Goals

- Hardware & Software Needed
- Controller Area Network (CAN)
- Circuit
- Code Examples
- Summary

In this tutorial you will learn how to use the CAN controller on the **Arduino UNO R4 Minima** board. The CAN controller is embedded in the UNO R4 Minima's microcontroller (RA4M1). CAN is a serial protocol that is mainly used in the automotive industry.

Please note that CAN controller requires an external transceiver to function. Instructions and hardware examples are provided in this tutorial.

Goals

The goals of this tutorial are:

- Get an overview of the built-in CAN library

- Learn how to connect a board to a CAN transceiver module

- Send a CAN message between two Arduino boards

Hardware & Software Needed

- Arduino IDE ([online](#) or [offline](#))

- [Arduino UNO R4 Minima](#)

- [UNO R4 Board Package](#)

- CAN transceiver module *

- Jumper wires

In this tutorial, we are using a SN65HVD230 breakout module.

Controller Area Network (CAN)

The CAN bus uses two wires: **CAN high** and **CAN low**. On the Arduino UNO R4 Minima, these pins are:

- D5/CANRX0 (receive)
- D4/CANTX0 (transmit)

To communicate with other CAN devices however, you need a transceiver module. In this tutorial, we will be using a SN65HVD230 breakout. To connect this, you can follow the circuit diagram available in the section below.

For this tutorial, we will use a simple example that sends a CAN message between two UNO R4 Minima devices. If you wish, you can also connect an existing CAN device to the UNO R4 Minima.

Circuit

To connect the CAN transceiver, follow the table and circuit diagram below:

UNO R4 Minima	CAN Transceiver
D5 (CANRX0)	CANRX
D4 (CANTX0)	CANTX
3.3 V	VCC
GND	GND

Then, between the CAN
transceivers, connect the

CAN Transceiver 1	CAN Transceiver 2
CANH (HIGH)	CANH (HIGH)
CANL (LOW)	CANL (LOW)

Code Examples

The following code examples needs to be uploaded to each of the UNO R4 Minima boards, one will send a message, one will receive it. These examples are available in the UNO R4 Board Package, and using the Arduino IDE, you can access them by navigating to **File > Examples > Arduino_CAN > CANWrite/CANRead**

The library used is built in to the Board Package, so no need to install the library if you have the Board Package installed.

To initialize the library, use

```
CAN.begin(CanBitRate::BR_250k)
```

, where a CAN bit rate is specified. Choose between:

- BR_125k (125000)
- BR_250k (250000)
- BR_500k (500000)
- BR_1000k (1000000)

CAN Write

To send a CAN message, you can create a `CanMsg` object, which should contain the `CAN_ID`, size and message data. Below is an example on how to create such

```

1 uint8_t const msg_data[
2 memcpy((void *)msg_dat
3 CanMsg msg(CAN_ID, size

```

After you have crafted a CAN message, we can send it off, by using the `CAN.write()` method. The following example creates a CAN message that increases each time `void loop()` is executed.

 Code Source on [Github](#)

```

1  /*
2   CANWrite
3
4   Write and send CAN
5
6   See the full docume
7   https://docs.arduin
8  */
9
10 /*****
11  * INCLUDE
12  *****/
13
14 #include <Arduino_CAN
15
16 /*****
17  * CONSTANTS
18  *****/
19
20 static uint32_t const
21
22 /*****
23  * SETUP/LOOP
24  *****/
25
26 void setup()
27 {
28   Serial.begin(115200

```

CAN Read

To read an incoming CAN message, first use `CAN.available()` to check if data is available, before using `CAN.read()` to read the message.

 Code Source on [Github](#)

```
1  /*
2   CANRead
3
4   Receive and read CA
5
6   See the full docume
7   https://docs.arduin
8  */
9
10 /*****
11  * INCLUDE
12  *****/
13
14 #include <Arduino_CAN
15
16 /*****
17  * SETUP/LOOP
18  *****/
19
20 void setup()
21 {
22   Serial.begin(115200
23   while (!Serial) { }
24
25   if (!CAN.begin(CanB
26   {
27     Serial.println("C
28     for (;;) {}
```

Summary

This tutorial shows how to use the CAN bus available on the UNO R4 Minima, and how to send and receive data using the `Arduino_CAN` library.
