Due Multiple Blinks Example

The Scheduler library allows the Arduino Due to manage multiple tasks at the same time.

Multiple Blinks

The Scheduler library allows the Arduino Due to manage multiple tasks at the same time. By setting up a number of other functions that run the same way `loop()` does, it's possible to have separate looping functions without a dedicated timer.

Hardware Required

Arduino Due Board
three LEDs
three 220 ohm resistors

The Circuit

The anode of the LEDs are connected in series with a 220-ohm resistor to pins 11, 12, and 13 on the Due. Their cathodes connect to ground.

[Code](#)[Help](#)

```
1 // Include Scheduler
2 #include <Scheduler.h>
3
4 int led1 = 13;
5 int led2 = 12;
6 int led3 = 11;
7
8 void setup() {
9
10     Serial.begin(9600);
11
12     // Setup the 3 pins
13
14     pinMode(led1, OUTPUT);
15
16     pinMode(led2, OUTPUT);
17
18     pinMode(led3, OUTPUT);
19
20     // Add "loop2" and
21
22     // "loop" is always
23
24     Scheduler.startLoop();
25
26     Scheduler.startLoop();
27 }
28
```
